Q10. The grey shells: how far they open

The Architect, 13 October 2026, for Godric. The ground floor at one scale, the layout PDF's (1930) before your marks; counts are every floor's.
A shell is the model's walls, floors, ceilings, doors and windows in grey light, built by the page from page/castle-model.js: nothing drawn, nothing spent.
Now: no shell built; the built rooms (the common room, the dormitory, the Fat Lady's corridor) are on the seventh floor.

10.1 Walk the ways; every room a shut door

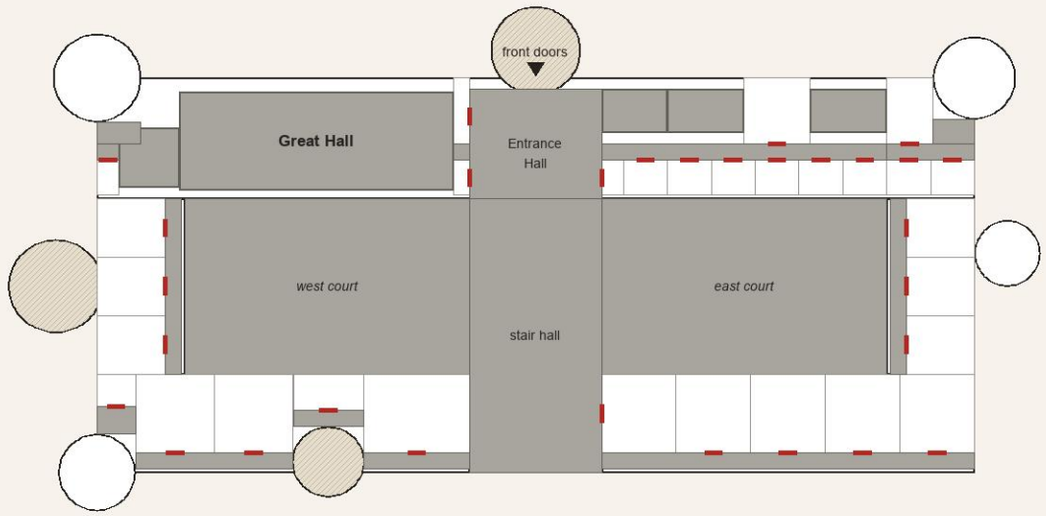

65 corridor runs and 34 stairs, the halls and courts: grey. Each room off them a door that answers a tap with why.

recommended

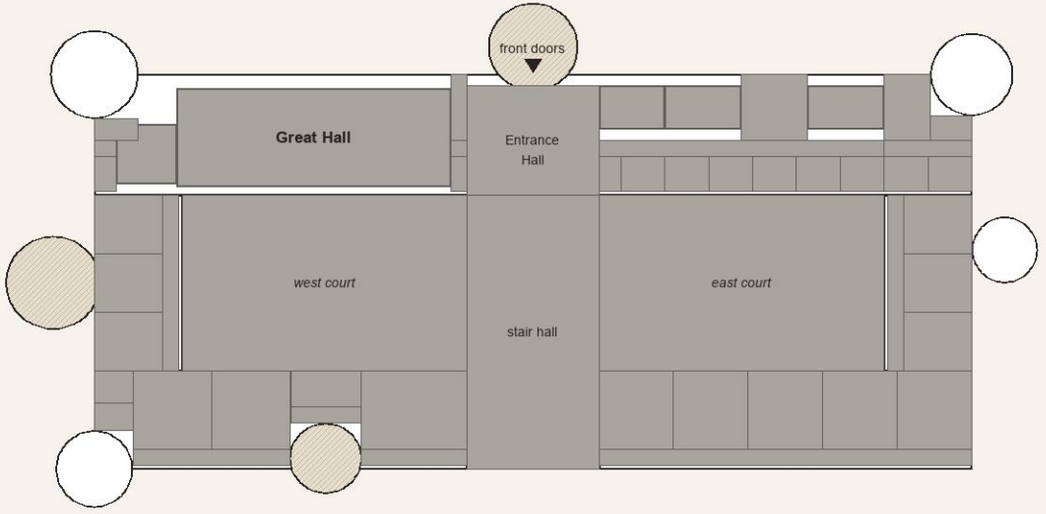

10.2 The named places open too

The same, and the 73 named places walkable as grey rooms; the 312 others shut doors.

10.3 Every space opens

The same, and all 385 spaces walkable as grey rooms; no door shut.

Key

- a grey shell he walks: walls, floor, ceiling, light, at true size
- a floor plan only: on the Map, behind its door
- a shut door: a tap says why (vocabulary 6); it opens when the room is built
- a tower held for req 235's answer: nothing of it built

The plan, in each option

One page, page/shell.html?place=<id>, and its builder page/castle-shell.js read the model; castle.js's frame, walking and travel unchanged. A model change re-shapes every shell. First the arrival route: the front doors, the Entrance Hall, the stair hall and its staircases, then the seventh floor to the Fat Lady. Req 236's niche goes in the Entrance Hall's shell. Waits on: your layout marks (the fill into the model), 235 for the towers. Opening a room is Events' and Magic's moment; a built room takes its shell's place.
