Question 9: the faces from British castles

The Architect, 13 October 2026, for Godric. Your answer to Question 8: "better but the facade still reads more like a modern hospital or something with the overly regular planes. research british castles." Proposed; nothing in the model moves.

Canon, checked at the gate: "Perched atop a high mountain on the other side, its windows sparkling in the starry sky" (PS 6). The study's finding: in real castles the height comes from the rock (curtains 12 to 16 m, rocks 27 to 80 m); ours is every range near +41.6 on a rock of 10 to 18 m.

Now: the south face from the boats as drawn at 12.15 am today (architect-accreted-0015, page 2)

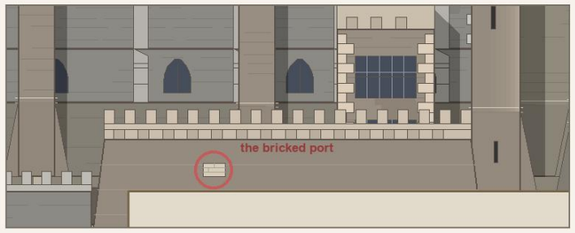

The castles it borrows from, in words (the study, ten castles; no castle images here)

Edinburgh	cliffs of 80 m, the hall on vaults over the terraced rock: the crag as the plinth (9.1)
Stirling	a crag of 75 m under the hall; mullioned lights at the hall's storey only (the crag 9.1; the windows both)
Dunnottar	small buildings on a cliff three times their height (9.1)
Bamburgh	a rock as tall as the buildings; ranges of different dates side by side (9.1; the coursing both)
Caernarfon	the Eagle Tower, ten-sided, machicolated, a water gate at its foot: the lake tower (both)
Warwick	Caesar's Tower, a quatrefoil from the rock; parapets boldly corbelled: the south-east tower (both)
Culzean	three eaves heights in one face, a storey apart: the stepped eaves, never two alike side by side (both)
Chepstow	an asymmetrical range of windows; a tower battered for most of its height: the windows and feet (both)
Harlech	rubble curtains, towers "not much higher" than the walls: the coursed rubble and repairs (both)
Tantallon	one great curtain, end towers dropping to the cliff edges: the ends of the crag (9.1)

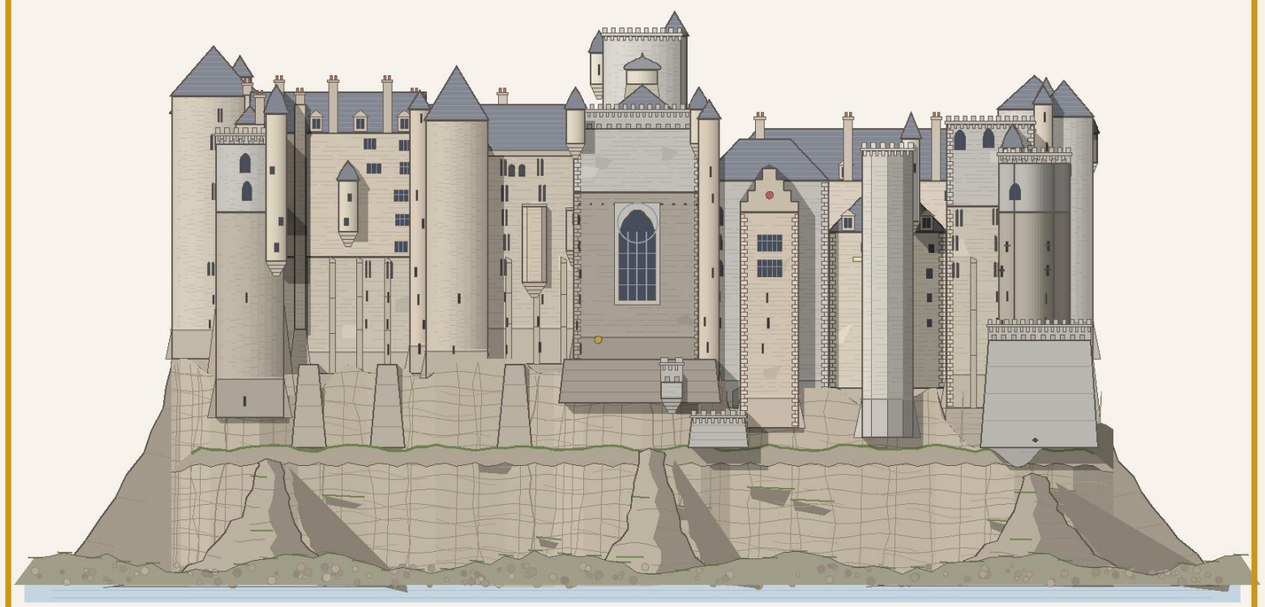

In both: few, irregular windows (none in an outward face's lowest storey, the big lights at the hall only), coursed rubble with repair patches, battered feet and string courses, parapets raised 0 to 3.4 m on corbel tables, the eaves stepped 3 to 9 m (a garret storey or a raised breastwork over the seventh floor; no floor moves), the lake tower ten-sided, the south-east tower a quatrefoil. Held as before: Gryffindor Tower and its built windows, the lead flat at +41.6 (req 198), the Astronomy Tower the highest.

Your Q8 touch, woven: the entrance front's 1540s bastion, one cannon port bricked up with newer stone

(a tap tells why: Peeves got hold of the powder). 1:500, from the north; in both options.

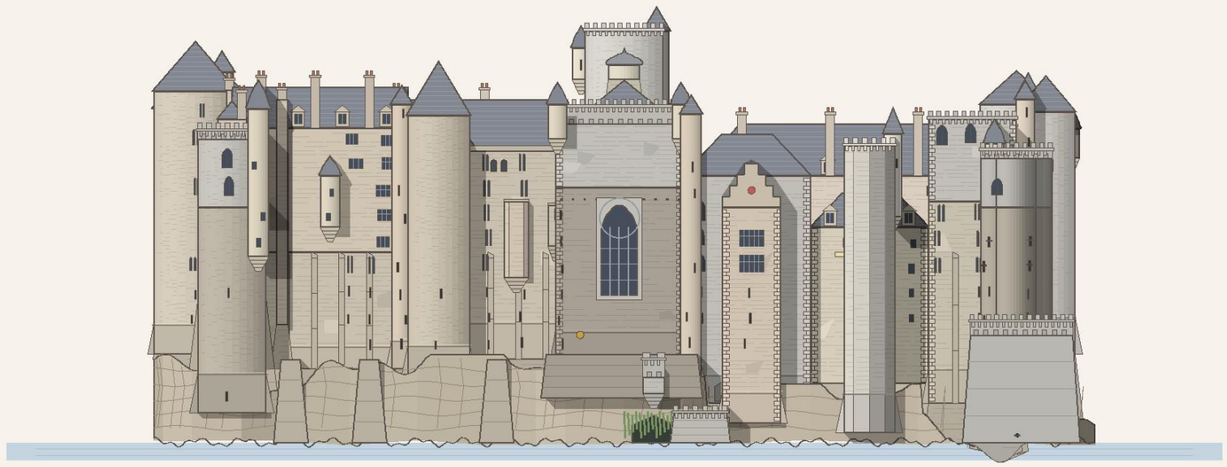

9.1 The high crag: the lake 28 m lower, the castle on a crag

Borrows the crag from Edinburgh and Stirling, the scale from Dunnottar and Bamburgh: the floors hold, the ground changes. The old waterline stays as a ledge at -18 carrying the spurs, the batteries and the bay's foot; the harbour mouth at the new water, so the boats' passage climbs the whole crag. It stands high over the black lake, as at the first sight (PS 6).

recommended

9.2 The same devices on the present rock

Borrows from Caernarfon, Warwick, Culzean, Stirling, Chepstow and Harlech (the list on the left), without the crag: the castle still stands 10 to 18 m over the water, wider than it is tall. Less redrawn (A-A keeps its harbour).

0 10 20 30 40 50 m — both faces 1:1250 at A3, from the lake (ours, proposed)
